Streamlining Waresix’s Cross-Functional Team Quotation Process, Resulting in a 57.2% Reduction in Completion Time

Website Project

Project overview

The problem

At Waresix, the quotation process involved three teams working in sequence:

1. **Sales**: Secured customer orders.
2. **Supply**: Gathered vendor prices.
3. **Pricing**: Finalized order prices.

This handoff-heavy flow caused major delays. Sales often lost potential deals because Supply took too long to collect vendor quotes. I was assigned to identify where the process broke down and design a faster, smoother workflow.

The goal

Speed up the quotation process so Sales can close orders quickly while reducing the Supply team's workload.

My role

I was the UX Designer, working with a Product Manager, UX Researcher, Engineering Manager, and team leads from all three departments. My work included:

- Conducting interviews and workflow analysis
- Mapping pain points and improvement areas
- Prototyping, testing, and refining solutions
- Managing alignment and feedback across teams

Duration

1 month

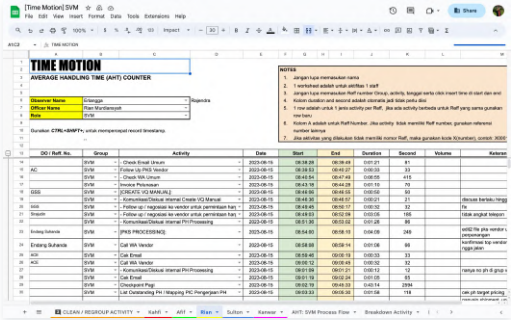
User research

I began with job shadowing and interviews with the Supply team, the main bottleneck. Observing their daily operations revealed where time was lost:

1. **Duplicate order**: Similar requests were reprocessed repeatedly
2. **Complex shipments**: Special constraints made vendor matching difficult
3. **Multiple vendor:** Each order required several price comparisons
4. **Slow responses**: Vendors often took hours or days to reply

One Supply officer said, “We already have this data from older orders, but can’t reuse it.” That became the foundation for my solution.

Observing Supply officers during their daily workflow to uncover bottlenecks.



Tracking task timelines to identify where most delays occurred.

Ideate solutions

Mapping the user journey across Sales, Supply, and Pricing showed too many repetitive tasks and dependencies. I then sketched two possible directions:

1. **Reuse past quotations**: Let Supply duplicate previous quotes.
2. **Empower Sales**: Let Sales set prices directly using historical data.

Option 1 was safer but didn't fix the bottleneck. Option 2 was faster but needed safeguards. We chose Option 2 and added an approval flow for unprofitable quotes to maintain control.

Supply Team

Goal: Find vendors to fulfill orders

ACTION	Search vendor price request	Adjust vendor price request sheets	Pitch order sheets to vendors	Recap vendor price	Send vendor price
TASK LIST	1. View and search vendor price request from requests list	1. Download request sheets 2. Edit request sheets	1. Draft message 2. Find vendor 3. Send message & order sheets	1. Receive vendor response 2. Recap vendor price for each order	1. View and search vendor price request from requests list 2. Input vendor price 3. Send vendor price
EMOTIONS	Confused	Annoyed	Annoyed	Annoyed	Curious
IMPROVEMENT OPPORTUNITIES	Reduce requests that Supply receive	Adjust requests sheets so Supply don't need to edit	Provide template message for each order sheets	Seamless vendor price recap feature	Seamless vendor price input feature

Mapping user journeys across teams to find major pain points.

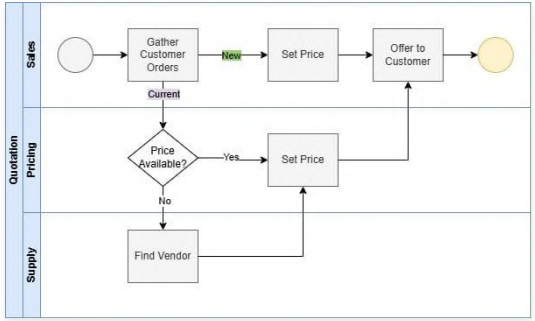
Sketching solution ideas and discussing trade-offs with stakeholders.

Low-fidelity prototype

I created a flow where Sales could check past prices, set profit margins, and request approvals. During stakeholder reviews, two things stood out:

- The new flow must stay as simple as the old one.
- Price approvals should be automated to avoid new delays.

When engineers raised concerns about linking legacy pricing data, we collaborated to define access rules and fallback logic. I simplified navigation, added automatic approval triggers, and built clear step-by-step screens.

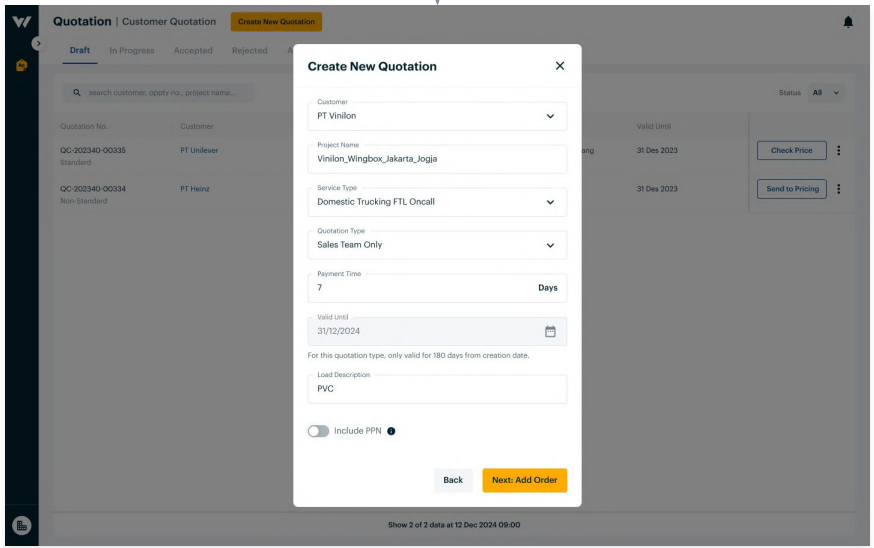


Revising the user flow to make the process faster and data-driven.

Building low-fidelity wireframes to validate ideas with all teams.

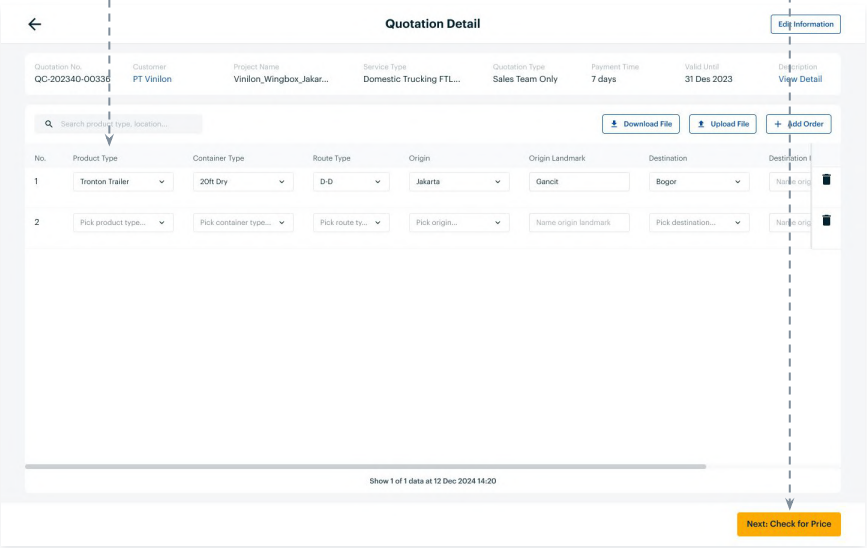
High-fidelity prototype

Simplified entry with tagging for easy organization.



Create Quotation

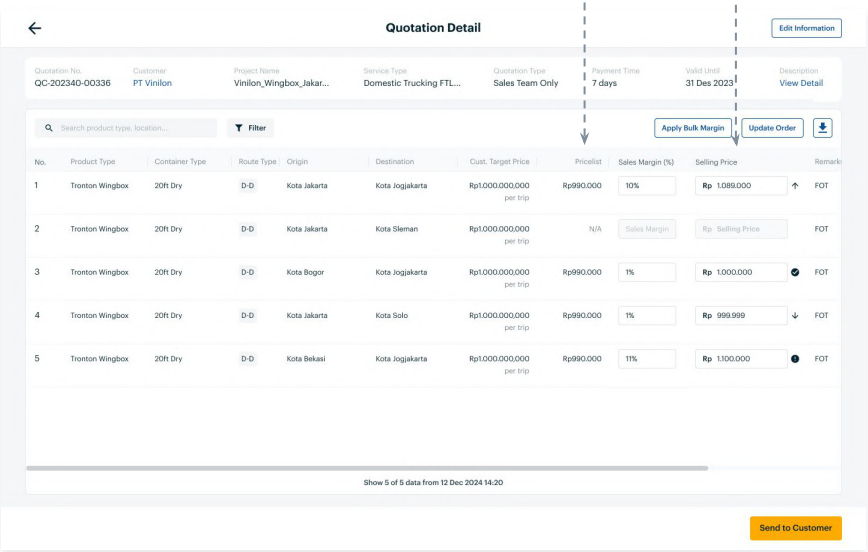
Users fill shipment details and view price suggestions.



Order Requirement

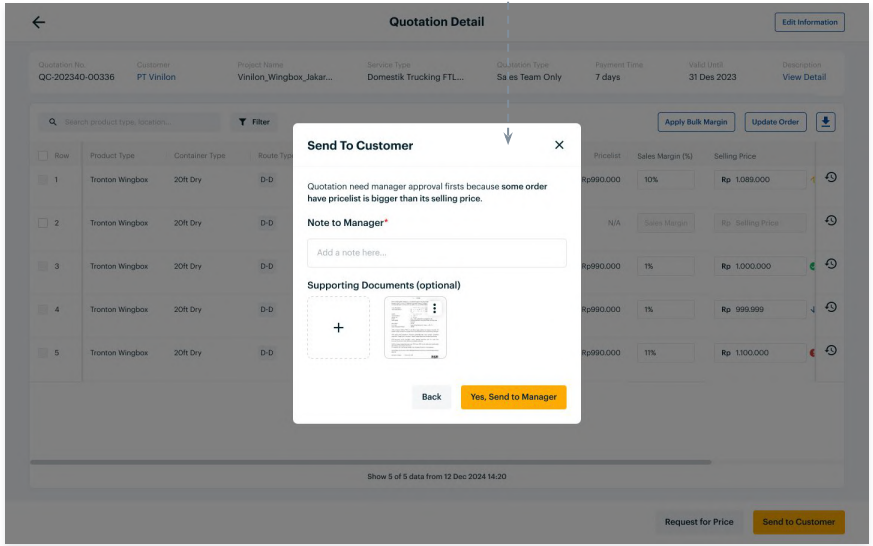
High-fidelity prototype

System recommends prices based on historical data.



Price Checking

Automatically routes risky or unprofitable quotes for review.



Request Approval

High-fidelity prototype

Sends instant approval requests with quotation details.

Quotation Approval Request

Hi Malvin Bestari,

Yohanes Bayu is asking for approval for quotation QN001. Below are the quotation details.

Customer	: Vinilon
Service Type	: Domestic FTL Trucking Oncall
Project Name	: Vinilon_Wingbox_Jakarta_Jogja
Valid until	: 31/12/2021

Please review the quotation by clicking on the button below:

View Quotation

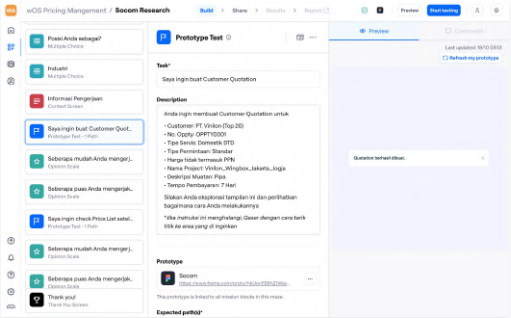
Usability testing

We tested the prototype with five Sales officers. Their feedback was sharp and practical:

1. “I need to see past prices.”
2. “I can’t tell if this quote is profitable.”
3. “What if there’s no past data?”

I refined the design to include:

- A Price History view and searchable Price Book
- Color-coded profit/loss indicators for clarity
- A Request Price option for missing data
- Trip Details and Documents for better context

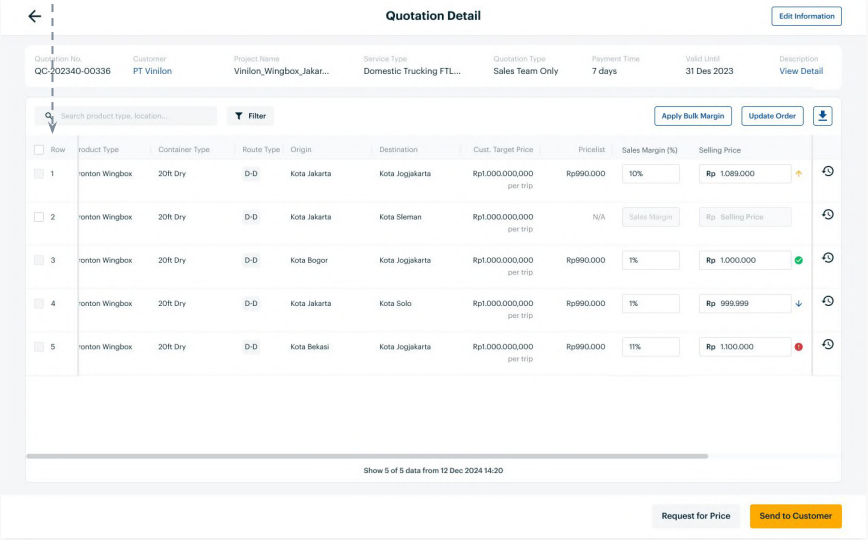


Setting up usability tests in Maze to capture user interactions and completion times.

Conducting in-person testing with Sales officers to observe real usage and collect feedback.

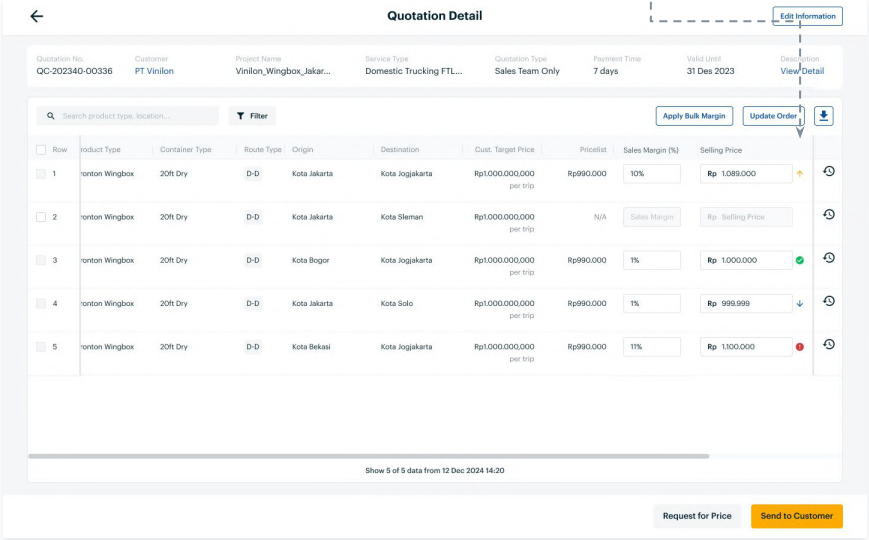
High-fidelity prototype

For orders without pricing history



Request Order Prices

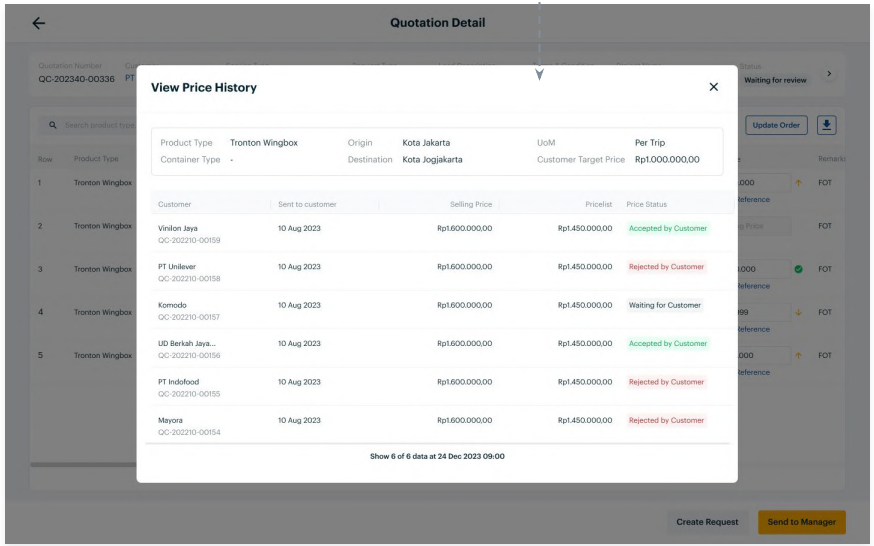
Clear, color-coded profit indicators



Set Order Prices

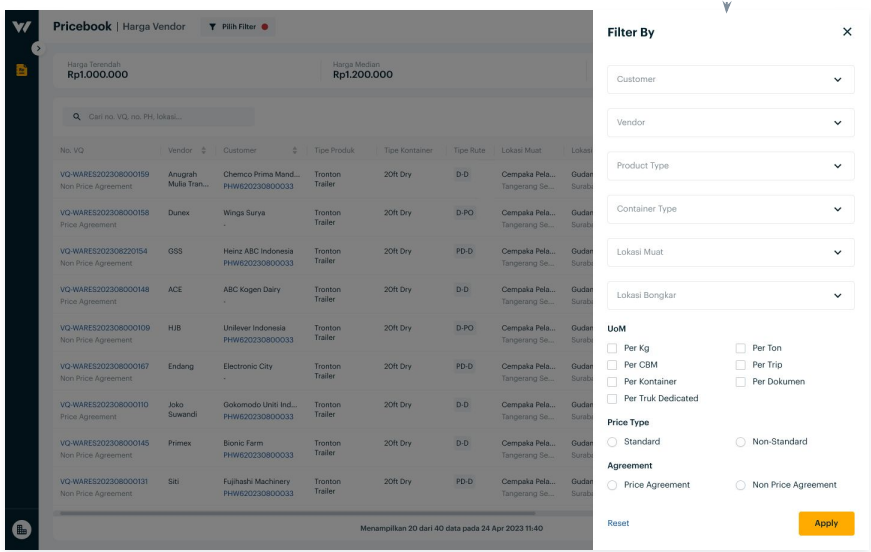
High-fidelity prototype

Easy reference for decision-making



View Price History

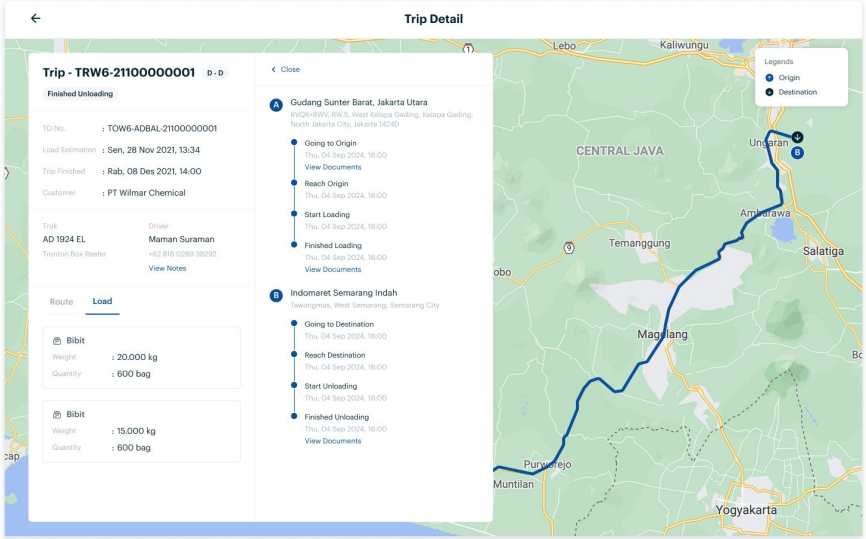
Centralized, filterable vendor price list



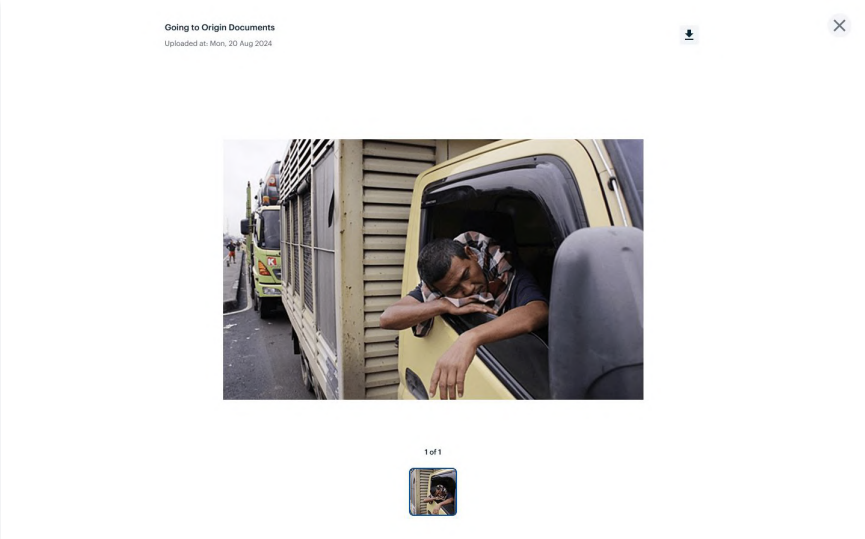
Price Book

High-fidelity prototype

Added shipment context for accuracy



Trip Details



Trip Documents

High-fidelity prototype

Auto-generated for fast handoff

Takeaways

The result

The redesign reduced the Supply team's workload and cut quotation time by 57.2%, helping Sales close more deals in less time.

What I learned

Cross-functional projects depend on communication and shared goals. The biggest success wasn't just faster quoting—it was aligning three teams under one streamlined process. If I revisited this project, I'd add real-time analytics to monitor quote performance and continuously identify new optimization opportunities.
