Redesigning Mobile App for Rumah Siap Kerja Students, Resulting in an Increase in Sales from ~5K to 712K within a Year

Mobile App Project

Project overview

The problem

Rumah Siap Kerja is an Indonesian edtech platform partnered with Kartu Prakerja, a government program helping citizens and fresh graduates gain new job skills through online classes.

Analytics revealed two major issues: few users purchased classes, and most who did never finished them. I was tasked to redesign the app to make learning simple, clear, and motivating from start to finish.

The goal

Improve the overall user experience and visual design to boost both class purchases and completion rates.

My role

I was the lead UX designer, managing two interns and collaborating with PMs, engineers, and marketing. My responsibilities included:

- Conducting user and competitor research
- Restructuring the information architecture
- Designing and testing new interaction flows
- Mentoring interns through design iterations and testing

Duration

1 months

User research

I reviewed support tickets and interviewed both active and inactive learners to understand where engagement dropped off. Key findings:

1. **Registration**: Too many fields made it feel lengthy and confusing.
2. **Payment**: Kartu Prakerja voucher redemption wasn't clear.
3. **Dashboard**: Users couldn't easily find their classes or certificates.
4. **Learning**: Lessons lacked progress indicators and feedback.

Using these insights, I created a persona representing first-time learners with low digital literacy, which guided every design decision.

Fani

Age: 25
Education: Bachelor Degree
Hometown: Bekasi
Family: 1
Occupation: Student

"I want to join classes with certificates that can help me during job hunting."

Goals

- Want to join classes with certificates that can be used during job hunting.

Frustrations

- Find difficulty in using Kartu Prakerja to buy classes

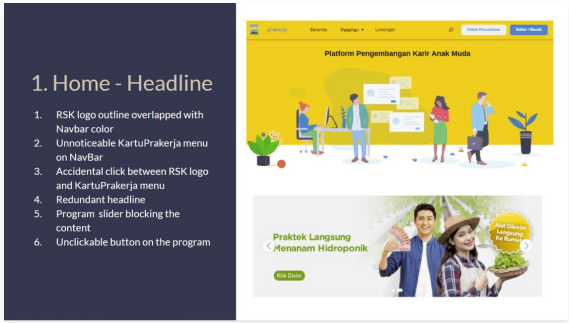
Fani graduated from a local university and is searching for a new job. She registered for her Kartu Prakerja card which can be used to purchase classes with certification to help her job search. However, she faces difficulty using Kartu Prakerja to purchase the classes she wants.

Creating a user persona to capture learners' goals, frustrations, and tech familiarity.

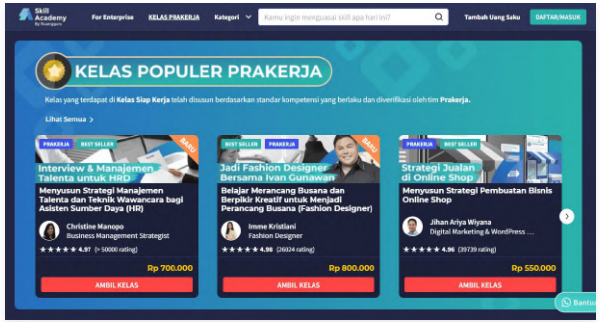
UX audits

I ran a heuristic review using Shneiderman's 8 Golden Rules and found the interface inconsistent and cluttered.
Then I analyzed competitors like Ruangguru and Udacity, which excelled at progress tracking and user motivation. Two key insights stood out:

1. Reduce mental effort at every step.
2. Reinforce motivation with progress and feedback.



Evaluating usability issues in the existing app to identify friction points.



Studying competitors to extract best practices for learning motivation and flow.

Low-fidelity prototype

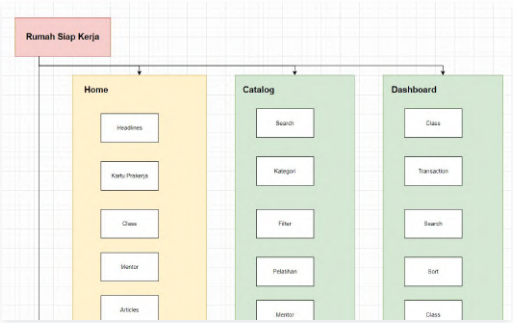
Information Architecture

The old structure buried key actions under multiple layers. I rebuilt it around three main goals: find classes, learn, and track progress, making navigation simpler and predictable.

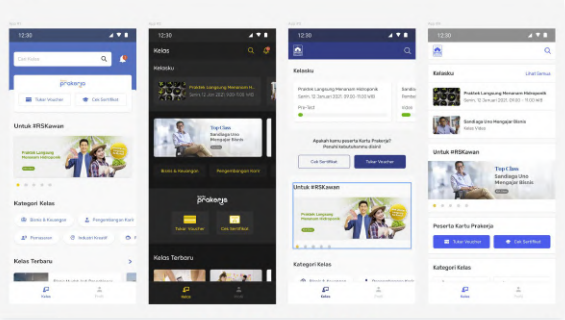
Prototyping and feedback

I created wireframes and presented them to C-levels, marketing, and operations. We debated how to balance promotions with usability. My stance: fewer distractions, more clarity. Two main directions came out:

- Keep the tone modern and friendly.
- Ensure every core flow (signup, purchase, learning) takes no more than three steps.



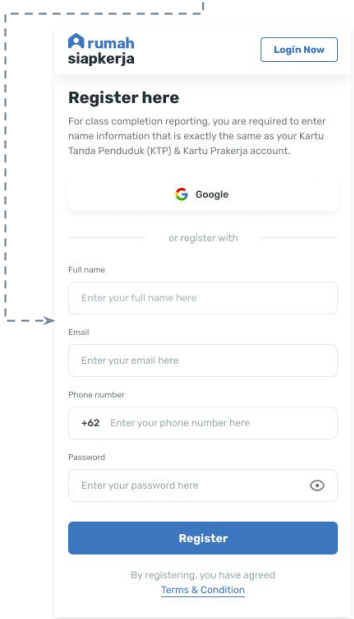
Reorganizing navigation to align with learners' main goals.



Sketching and testing early visual directions with stakeholders.

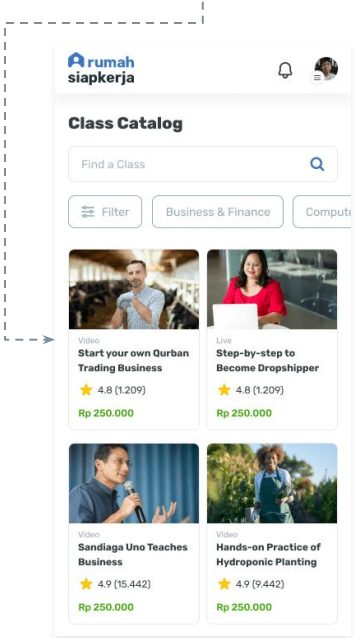
High-fidelity prototype

Reduced required fields and added social sign-in for faster onboarding.



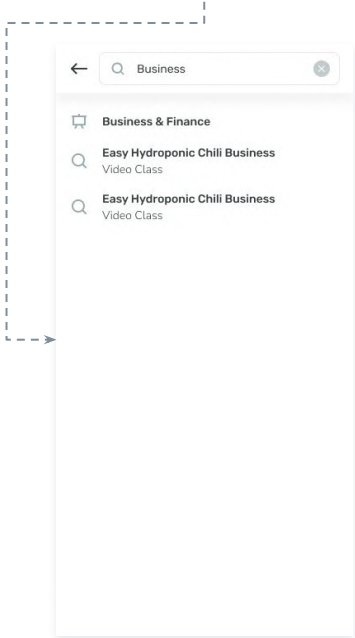
Registration

Displayed only essential details for quick scanning.



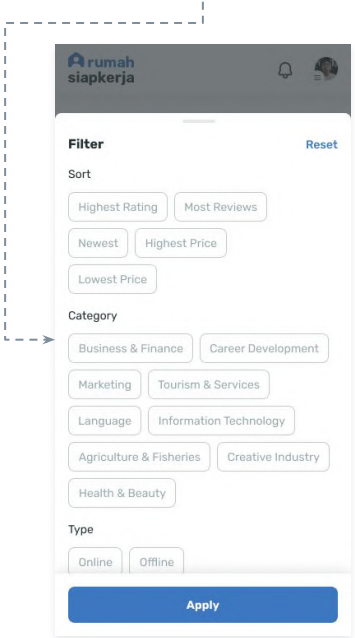
Catalogue

Unified results for classes and categories.



Search

Added flexible sorting by rating, price, and type.

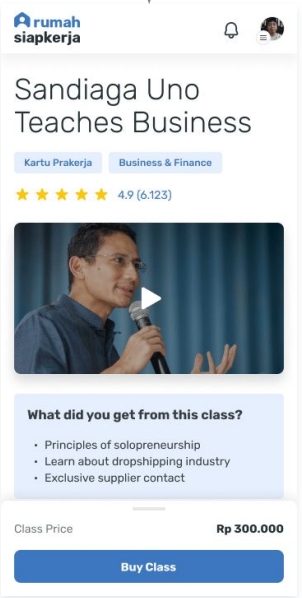


Filters

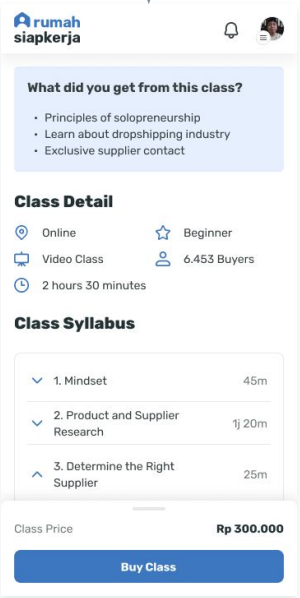
High-fidelity prototype

Persistent purchase button and clear syllabus layout.

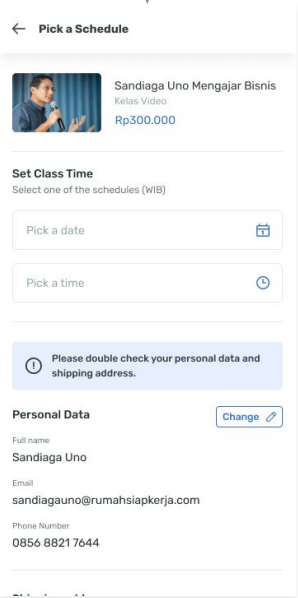
Combined bottom sheet and date selector for clarity.



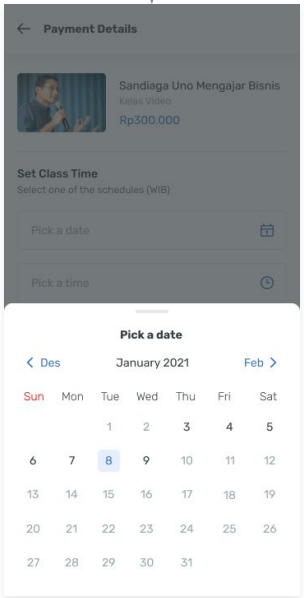
Class Details



Syllabus



Scheduler

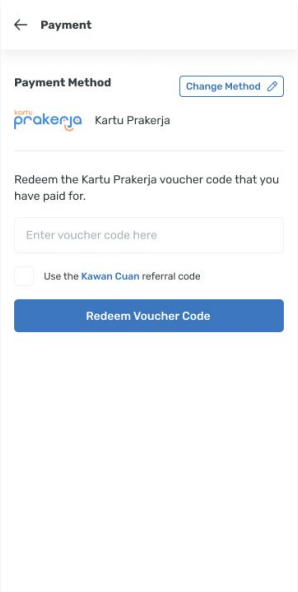


Pick Date

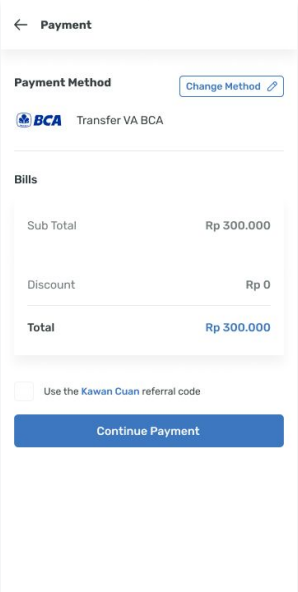
High-fidelity prototype

Defaulted to Kartu Prakerja with alternative options available.

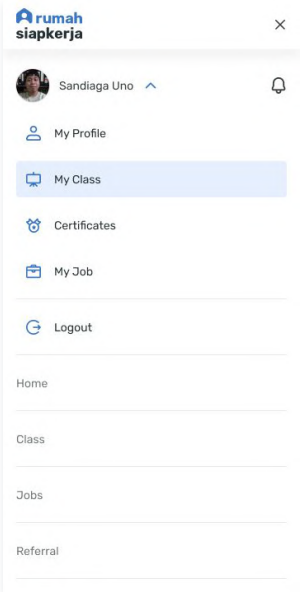
Tabs and filters for managing active and completed classes.



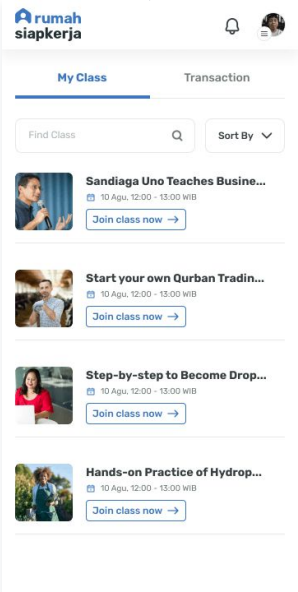
Payment with Kartu Prakerja



Payment with other method



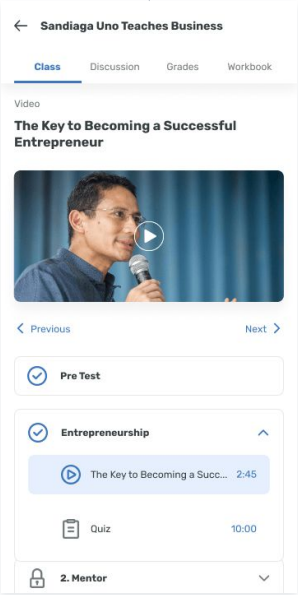
Navigation Menu



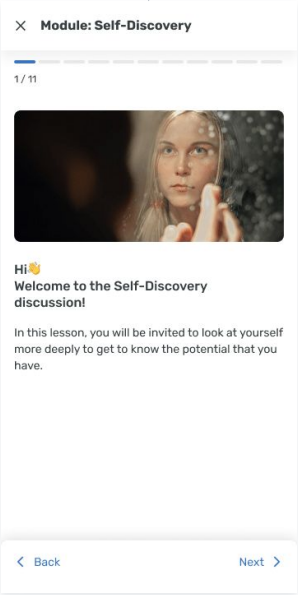
Dashboard

High-fidelity prototype

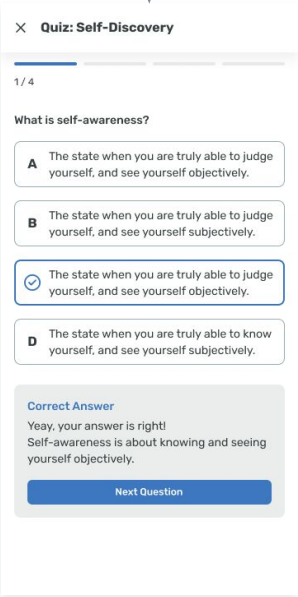
Structured lessons into short playlists with built-in quizzes.



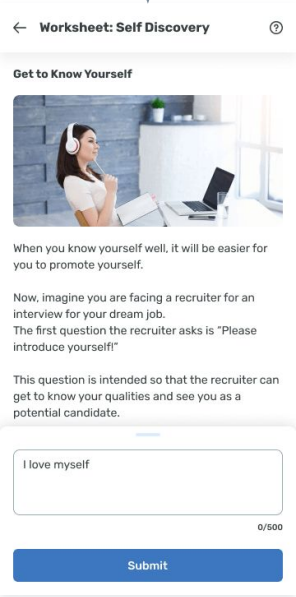
Class Learning



Readings



Quizzes

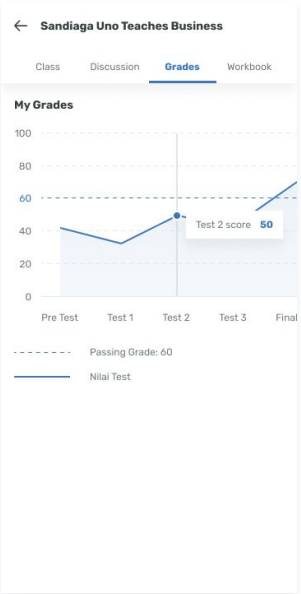


Essays

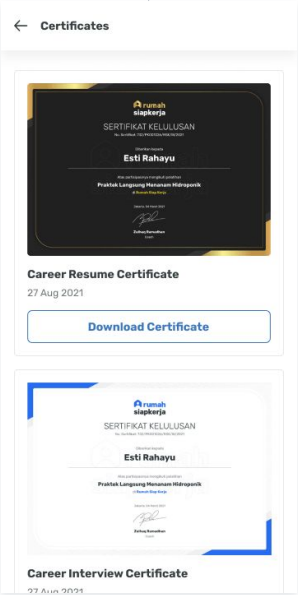
High-fidelity prototype

Accessible directly from the dashboard.

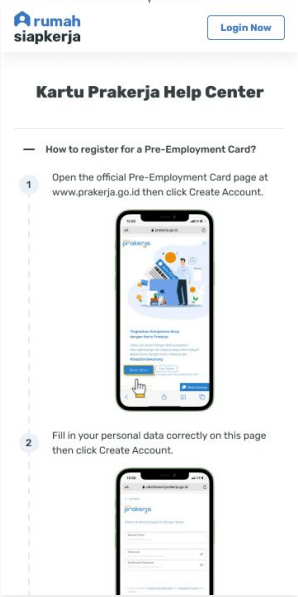
Added in-app support to reduce customer service load.



Grading



Certificates



Help Center

Usability testing

We conducted two rounds of testing with target learners. Round 1 findings:

- Users didn’t understand what each class included.
- Voucher redemption remained confusing.
- Certificates were hard to locate.

Improvements implemented:

- Added Kartu Prakerja tags for eligible courses.
- Introduced active/completed filters in the dashboard.
- Simplified voucher redemption with inline instructions.

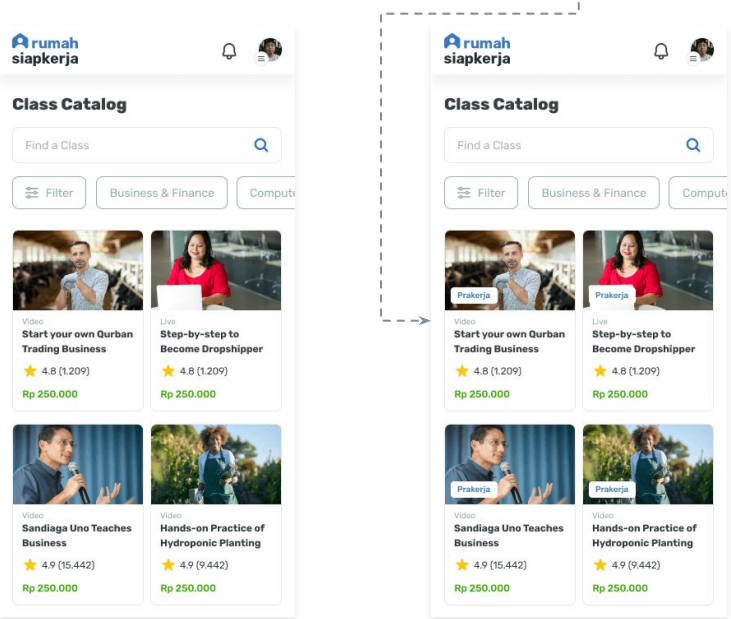
[Task Completion Rate]

No.	Scenario	Success	Failed	Completion Rate
1.	Membuat Akun RSK	5	0	100%
2.	Mencari Kelas “Menanam Hidroponik”	4	1	80%
3.	Membeli kelas menggunakan kartu prakerja	4	1	80%
4.	Masuk ke kelas “Menanam Hidroponik”	4	1	80%

Tracking task completion and identifying friction points during testing.

High-fidelity prototype

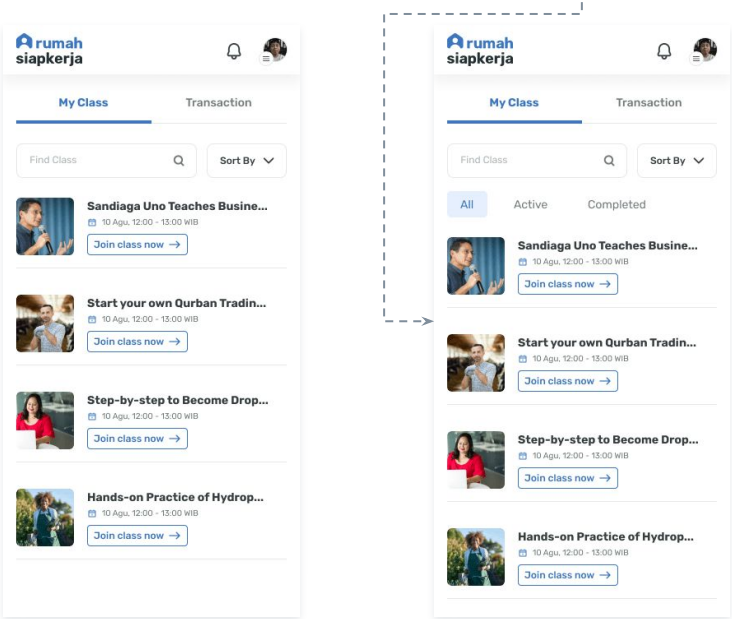
Added visible Kartu Prakerja tags for faster course recognition.



Before

After

Added dashboard filters to help users find certificates easily.



Before

After

Takeaways

The result

- **Users**: Grew from ~8K to ~574K
- **Sales**: Increased from ~5K to ~712K
- **Completions**: Jumped from ~4K to ~459K

What I learned

Designing for new digital users means prioritizing simplicity at every level. I learned how to balance stakeholder demands while keeping the user's experience central. Managing interns also strengthened my leadership and mentorship skills. If I revisited this project, I'd implement an analytics dashboard to track user behavior and validate design improvements after launch.
